Subject: Meeting with EPA

Chris – when we talked on Friday, I told you we would like to meet in person. The reason for this is that the District would present the results of three studies performed since our last meeting at Region 5.

1. A study of how product temperatures at the end of the dryer heated zone compare to temperatures measured at the discharge screw conveyor (i.e., the current temperature monitoring point). The District obtained 92 grab samples from the end of the heated zone. All heated zone temperatures exceeded 176° F. Heated zone temperatures averaged 28° F higher than the discharge screw conveyor temperatures.
2. Two months of weekly results comparing fecal coliform concentrations at production, shipping, and bagging. At all three sample points, results are consistently near the level of detection.
3. A study of time and temperatures within the recycling bins, obtaining 55 measurements of time and temperature. Results show that times and temperatures are sufficient to destroy pathogens. This study represents an additional compliance demonstration under the Part 503 regulations.

Just felt I needed to state this better than I did on the phone. We look forward to meeting with you.
